Caterpillars

The butterfly egg is very small. It is laid on a plant leaf and stays there for a few weeks. When some time has passed the caterpillar comes out. It is very hungry and feeds on plant leaves all the time. When it stops feeding it attaches itself to a twig and transforms into a pupa. The pupa hangs down from the twig and the caterpillar starts to turn into a butterfly. Soon the pupa splits and out comes the butterfly. That butterfly will lay an egg and the process will start again.
